Business Context

Information About Local Producers

The client has asked me to provide customers with information about the producers, their methods and the benefits of buying locally. This benefits the client as through this the company shows transparency with the customers which allows them to build a relationship with the customer based on trust as it removes any suspicion or anxieties the customers might have about the product being sold. Also, giving the customers information about the benefits of buying locally allows the company to provide more personalised service which makes the customer feel valued by the company. This then builds loyalty for the company.

Transparency Of Product Pricing And Availability

The client has asked me to develop a digital solution that allows a customers to view products with transparent pricing and availability. This would benefit the client as being transparent about pricing and availability to the customers from the start further builds trust and loyalty with their customers. By providing information about the pricing and availability from the start saves both the time of the customers and the time of the sales team as interested customers can deduct whether or not the products fits their budget and is available for purchase and the sales team can focus more on meaningful customer service instead of answering multiple questions regarding the pricing and availability of a product.

Place Orders For Collection And Delivery

The client has asked me to develop a digital solution that allows customers to place orders for collection or delivery. This would benefit the client as it would lead to an increase in sales. This is due to the fact that customers can still purchase products without having to go to the store thus increasing the overall sales. This also increases the user experience of the customer as they are able to shop at their own convenience and pace anywhere of the day. This would also benefit the client as the flexibility of the ordering options makes the ordering process enjoyable for the customer leading to good reviews for the company on the internet. This also attracts multiple types of customers for the company due to the multiple ways they can receive a product like families and workers who prefer online shopping.

Manage Accounts And Order History

The client has asked me to develop a digital solution that allows customers to manage their accounts and view order history. This benefits the client as customer's having accounts encourages them to revisit the website because their details and past orders are saved making for quicker purchases in the future. This feature improves the user experience of the customer as they are able to seamlessly manage

their personal data and orders. This also benefits the client as this leads to the reduction of customer service times because customers can view their past orders themselves rather than contacting the customer service department of the client.

Producer Stock and Order Management Dashboard

The client has asked me to provide a dashboard to enable producers to manage stock levels, update product details and view orders. This would benefit the client as it allows the producers to update the stock themselves leading to an always accurate availability of products which would prevent customers from buying a product which is out of stock thus improving the reliability of the company. Another way it benefits the client is that it improves the overall efficiency of the business as producers can view and manage any incoming order from the dashboard allowing them to ready products faster. Through this feature the producers can quickly update the product details ensuring the website is always up to date with the latest product information for customers.

Order Management, Scheduling and Tracking

The client has asked me to incorporate order management, scheduling and tracking features into the digital platform. This benefits the clients as this improves operational efficiency because orders are w processed automatically instead of manually and Scheduling also ensures that all services are planned properly. This also improves customer satisfaction as customers are able to know the current status of their order.

Customer Loyalty Scheme

The client has asked me to create a customer loyalty scheme that provides discounts and special offers. This solves the problem of the low customer retention by rewarding frequent returning customers with discounts or free items through a digital loyalty scheme thus benefiting the client as this will entice new customer to become frequent customers. An increase in customer will also allow Greenfield Local Hub to earn extra revenue on a consistent basis. Also offering rewards to frequent customers will create a better relationship with customers.

Accessibility Features

The client has asked me to create accessibility features to support a wide range of users. This would allow customers with disabilities to use the website with little to no hindrance due to features like text to speech or feature to increase and decrease texts sizes. This would ultimately increase the user experience of the customer which would increase customer retention for the company.

Project Aim

The overall aim of the project is to provide Greenfield Local Hub (GLH) with an online platform that:

- Provide information about the producers, their methods and the benefits of buying locally
- Allow customers to view products with transparent pricing and availability
- Allow customers to place orders for collection and delivery
- Allow customers to manage their accounts and view order history
- Provides a dashboard to enable producers to manage stock levels, update product details and view orders.
- A system for order management, scheduling and Tracking features
- A loyalty scheme that provides discounts and special offers
- Accessibility features to support a wide range of users.

Functional Requirements and User Acceptance Criteria

Users' Personas

Clementine- A regular customer of Greenfield Local Hub

Ellie- A new customer of Greenfield Local Hub

Connor- A producer who manages stock levels and updates product details

Functional Requirements Table

Functional Requirement	User Story	User Acceptance Criteria	Justification
Users able to register	As Ellie, Clementine or Connor I want to be able to register an account to	• Interact with a register button • Navigate to the Register page • Enter personal information	By being able to register an account users have clear access to personalised features the

	access full features of the website.	- Interact with the create button then be redirected to the home page. - Page meets WCAG 2.1 AA standard	website provides tailored specifically for the user and also they can securely log in to their account using a username and password which protects their personal information as well as their order history
Users able to log in	As Ellie, Clementine or Connor I want to be able log in to my account, so that I can access the features of the apps using my account data	- Interact with a Log in button - Navigate to the Log in page - Enter Account information - Interact with the Log in button then be redirected to the home page. - Page meets WCAG 2.1 AA standard	The ability to log in grants users secure access to their personal data as only the owner and rightful user of the account can access their account information. It also allows for a personalised user experience.
Users able to change their log in details	As Ellie, Clementine or Connor I want to be able to change my log in details and set new log in details	- Interact with a Log in button - Navigate to the Log in page - Interact with log in change button - Enter new log in details - Interact with the confirm button to confirm log in information - Page meets WCAG 2.1 AA standard	This feature enhances security as users can effectively change their password if there is to be a breach in security which mitigates the risk of unauthorised access. This feature also allows for user to recover their accounts if log in details are forgotten
Customers be able to view information about the producers	As Ellie and Clementine I want to be able to view information about the producers, their methods and the benefits of buying locally so that I can feel	- Users can log in or register successfully - Users can view home page after log in - Users can locate the "Producer details" option.	By allowing the customers to view information about the producers, their methods of producing food and benefits of buying locally, Their trust for the company's

	confident in the products quality and safety	• Users can view the list of Producers • Users can view Producer names, roles, methods and contact details • Users can navigate through the benefits of buying locally • Users can return to the homepage or previous section easily • Page meets WCAG 2.1 AA standard	products is substantially increased and Customers are then encouraged to make informed decisions when purchasing products and shows that the company takes full responsibility for the products that are being produced and put in stock.
Customers be able to view all products prices and availability	As Clementine and Ellie I want to be able to view all products prices and availability to make an informed decision before buying	• Log in or Register • View home page • View the Product section on the homepage • View Product details • View Product Pricing and availability • Users can easily navigate between Categories • Page meets WCAG 2.1 AA standard	When customers are able to see the prices and availability of products it ensures transparency between the Company and the customer thus building trust because customers feel the company's honesty about their products and offers. This will also improve customer satisfaction as they wouldn't need to customer service in order to find out the prices of products and if they're available
Allow Customers to be able to place orders for collection and for delivery	As Ellie and Clementine I want to be able to place orders and choose either collection or delivery so that I can choose how I'd like to receive the product	• Log in or Register • View homepage • View Product section • View the products on the product section • View the products details • View Order button for each product	Through this customers are able to choose what option suit them which improves the overall customer experience. This also benefits the client as there would be an increase in sales

		• Interact with the order button which redirects the user to the order page • View all products details in the ordering page. • Select delivery type and special requests • Fill in the payment details • View and interact with the finish button to process the order • Page meets WCAG 2.1 AA standard	due to customers being able to purchase products without needing to visit the store physically.
Allow customers to be able to manage their accounts and view order history	As Clementine and Ellie I want to be able to be able to manage my account by being able to view my account details, update personal info as well as be able to view my order history so that I can be confident all personal details are accurate and also have a faster experience when ordering a product previously purchased	• Log in or Register • View homepage • View Account / Profile Navigation button • Interact with the Account / Profile Navigation button • View account settings • Interact with account settings • View Manage Account section • Users should be able to make changes to their account such as changing their password • Users can choose save changes • Whilst on the Account page Users should be able to view Order history section • Interact with the order history section • View all the details of pervious orders	This feature allows for customer to view their past purchases and reorder products without needing to search for it again. This improves customer experience. This also improves customer loyalty as customers with accounts linked to the company website are more likely to return and continue buying from the same company

		• Page meets WCAG 2.1 AA standard	
Creation of a dashboard for Producers to Manage stock levels, update product details and view orders	As Connor I want to be able to manage stock levels, update product details and view orders to prevent running out of popular items and make sure customers see accurate current information	• Log in • Interact with the Account/Dashboard button • Navigate to Product section • View list of Products • View the current stock for each product • Update stock • Save changes • Interact with the Product details button to edit • Update products • Double check updates for accuracy • Interact with the save updates button • Navigate to order section in the dashboard • View list of all orders • Interact with the order to view full details • Page meets WCAG 2.1 AA standard	A dashboard would be beneficial to the client as it would allow producers to be able to constantly monitor stock levels real time to prevent running out of popular items and ensuring the company maintains correct amount of stock. It also boosts the company's reliability as customers are always able to see accurate up to date information.
Allow customers to be able to manage their orders, schedule their orders and Track their orders	As Ellie and Clementine I want to be able to manage my orders, schedule my orders and track my orders so that I would have accurate information on when my order is going to be delivered to me. As Connor I want to be able to use order	• Log in • View homepage • View order section • View Order history section • Interact with "All Order's" button under order history section • Interact with "All orders" • Select specific order • Select order details	These features improves customer satisfaction and efficiency of operations as being able to allow customers to manage, schedule and track their orders reduces the need for customer support whilst also providing transparency throughout the process of delivery.

	management features so that I can keep customers updated on the progress of their order.	• View estimated delivery date • Schedule or reschedule delivery • Receive confirmation of any order changes	
Provide discounts or rewards to frequent customers	As Clementine I want to be able to get rewards for being a frequent customer, so that I feel appreciated and valued as a frequent customer as well as save money on my orders. As Connor I want to be able to add discounts and rewards to frequent customers so they can be encouraged to revisit the website and continue purchasing products	• Log in • View homepage • View Product section • View Products on the Products section • View Discount or free gifts on certain products • View discounted price on the ordering page • Interact with the purchase button and purchase with discounted price • For the Producer • Log in • View homepage • View product section • View product details • View discount button • Add discount to product • Save changes • Page meets WCAG 2.1 AA standard	Offering discounts to frequent customers is a strategy proven useful increasing customer retention and bringing in new customers to the company. This would ultimately cause the clients company and business to grow.
Provision of accessibility features to support a wide range of users.	As Ellie and Clementine I want to be able to use and access the full features of the website despite any accessibility needs that I could have	• Log in • View homepage • Enable accessibility features • Adjust text size • Enable high contrast mode • Text to speech feature reads all the contents of the page correctly	This feature is beneficial to the client because it allow the company to follow the legal requirements under the Equality Act 2010 and WCAG 2.1 guidelines thus preventing any legal or

		Page meets WCAG 2.1 AA standard	reputational risk to the company. This feature also allows the website to be used by users with multiple different disabilities like visual or cognitive impairment allowing for a broader customer base
Provision of access control through user roles	As Clementine, Ellie and Connor I want to be able to access and view pages that are relevant to me to make sure I don't do something I'm not permitted to do.	- Log In - View all pages - User tries to visit an access denied page - Access denied displayed to an unauthorised user - Authorised user is granted access to the page	Through this, customers are only able to access their own information which removes the risk of customer being able to view other customers personal data. This will benefit the client as this will build more trust and loyalty from the customers to the company because they know their persona information and data is being kept safe and private from other customers. By this the client is also following Data Protection laws set in place

Non Functional Requirements

Performance

Requirement	Justification	KPI
The webpages must load in industry standard time.	This will allow a good user experience and customer retention if webpages are loaded quickly and create a good reputation for the clients website	Webpages should load fully within 15 milliseconds. 95% of the page should load within 3 seconds.

		Time to first byte must be under 200ms
The system must handle a specific number of requests without degradation.	This will ensure the core function of the website will still work at a busy day without slowing down website significantly.	The System must be able to support at least 1000 simultaneous users The response time must not be more than 2 seconds under peak load The Error rate in the system must be below 1% during high traffic
CPU usage should not exceed a set amount	This will ensure low end devices can use the website without sacrificing significant speed of the website.	The CPU usage must not exceed 7% under normal load The CPU usage must not exceed 90% under peak load Performance must be tested on devices with a minimum of 2GB of ram
Input delay should be at or under industry standards	This will ensure the website feels responsive which will create a better user experience over other competitors who have less responsive websites.	Input delay should be at or under 200 milliseconds Interaction to Next Paint must be under 200 milliseconds Input responsiveness must be tested across all major browsers
Payment should be processed quickly.	This will allow the customers to feel like that the website is responsive as it will not take long to process the payment.	The payment should be at an industry standard speed The confirmation of payment must be returned within 5 seconds Failed Transactions must be reported within 3 seconds

Security

Requirement	Justification	KPI
All sensitive data should be encrypted both in transit and at rest	This ensures that user data is protected from unauthorised access which is essential for building trust	100% of sensitive data should be encrypted using SSL/TLS while stored All data in transit must use TLS 1.2 or higher The compliance of encryption must be verified through annual security audits.

All User accounts should have a strong, multi-factor authentication	MFA provides an extra layer of security, reducing the risk of unauthorized access due to weak or compromised passwords.	95% of should have MFA enabled. MFA must be enforced for all admin and privileged accounts Authentication failures must be logged and reviewed monthly
Payment data must be handled using PCI-DSS compliant tokenisation.	Because users can save an abundance of payment methods, the system should not store actual card numbers. Using tokenisation ensures that even in the case of a breach, user data remains secure, protecting the business from legal liability and responsibility	Zero storage of raw credit card numbers in the system. All payment processing must fully comply with PCI-DSS. Tokenisation must be validated through annual third party audits

Capacity

Requirement	Justification	KPI
The system shall support a minimum of 10,000 simultaneous users without degradation.	Ensures system reliability during peak usage and prevents service outages.	Average response time must be ≤ 2 seconds with 10000 simultaneous users The Error Rate must be $\leq 0.1\%$ under peak load. The 95th Percentile response time must be ≤ 5 seconds
The system should process a minimum of 2,000 transactions per second (TPS) during peak hours.	Maintains business continuity under heavy transaction loads.	Sustained throughput of 2,000 TPS during peak testing The rate of transaction failure must be below 0.05% a peak TPS Queue backlog must be cleared within 30 seconds of peak subsiding
The website should be able to store data of many customers without overwriting previous data of other customers.	This will allow the website to handle the storage customers' details and orders, without cost the constant need to upgrade the storage. Additionally, it will avoid	The website should be able to store up to 100TB of data. Data retrieval accuracy rate must be 100%

	customers getting frustrated if they website cannot store their details or orders.	Storage utilisation alerts must be triggered at 80% capacity threshold.
--	--	---

Scalability

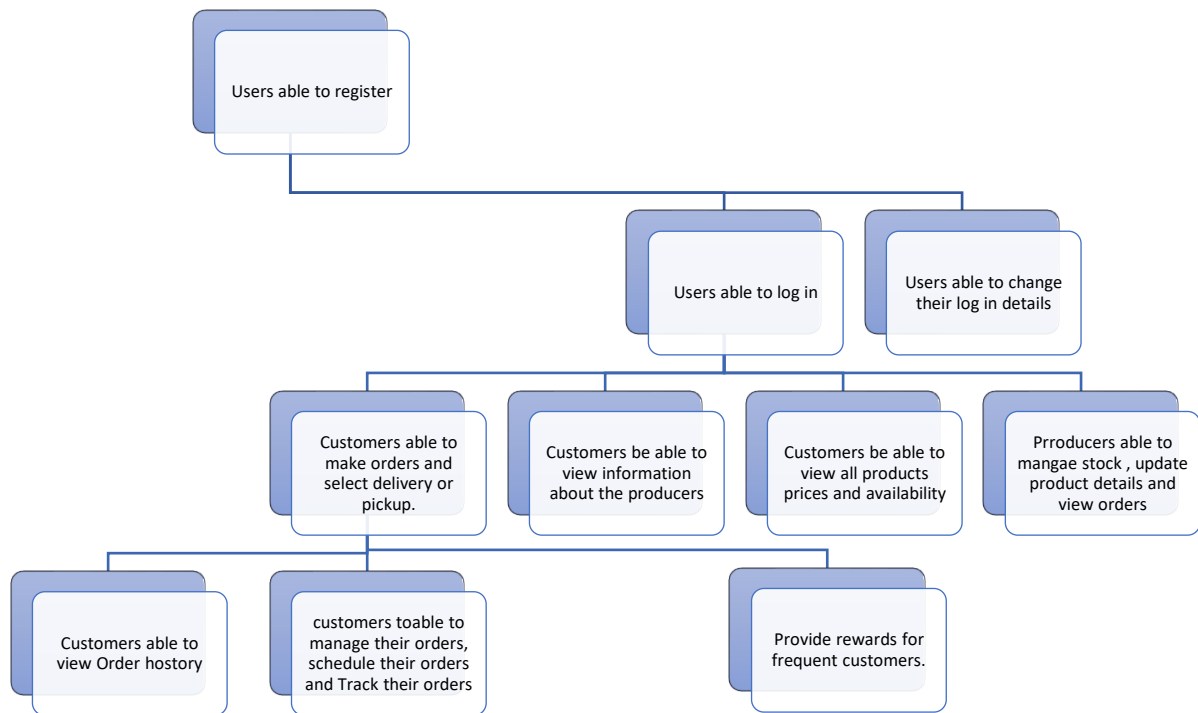

Requirement	Justification	KPI
The system should support scaling by adding instances without downtime.	Allows growth without disrupting active users.	Zero service downtime during horizontal scaling New Instance ready to serve traffic within 60 seconds of launch Load balanced evenly across all instances
The system shall support scaling of CPU, memory, and storage resources.	Provides flexibility for performance optimization.	Performance improvement $\geq 30\%$ after vertical scaling Resource upgrade completed with < 5 minutes scheduled maintenance CPU utilisation reduced by $\geq 20\%$ following memory scale-up
The code should be easily maintained and understandable by others.	This will allow the website to get more features more efficiently as other developers can understand the code easily.	A third party should be able to understand the coding conventions and logic being used in the solution and edit the code easily after a week of reviewing. Code coverage by automated tests should be $\geq 80\%$ Average time to onboard a new developer ≤ 3 days

Usability and Accessibility

Requirement	Justification	KPI
The system should maintain consistent design across all interfaces.	Reduces cognitive load and user confusion.	UI consistency score $\geq 90\%$ in design review User error rate must be $\leq 5\%$ on first-time task completion

		Design audit pass rate should be $\geq 95\%$ across all pages
Website should have intuitive and consistent navigation	This ensures user can easily find the right content and reduces frustration, which reduce drop-off rates of the website.	Any page should be able to be reached within 3 clicks from the homepage. Frequently used pages should have link on the navigation bar to be clicked on. User Satisfaction score for navigation should be $\geq 4/5$ in usability testing
The system should support keyboard navigation and assistive technologies.	Enables access for users with disabilities.	100% keyboard navigation coverage for core features WCAG 2.1 AA compliance score of 100%. Screen Reader compatibility verified across top 3 screen readers
Should have maintain consistent visual design and content tone throughout all pages	This will allow for better brand recognition and build trust for customers, due to consistency in the visual design.	All pages should fully adhere to the design document of the website. Brand consistency audit score must be $\geq 95\%$
The system shall provide clear error messages and recovery guidance.	Minimizes user frustration and task failure.	$\geq 90\%$ successful task recovery rate User comprehension of error messages must be $\geq 85\%$ in usability testing Average to time to recover from error should be ≤ 60 seconds

Hierarchy Diagram

Risk Management

General Project Risks (GPR)

1. Scope creep due to unclear project requirements
2. Key Team member unavailable
3. Insufficient testing leading to undetected bugs at launch
4. Unrealistic project milestones and deadlines

General Technical Risks (GTR)

1. System integration failures between third-party APIs
2. Scalability limitations under peak user demand
3. Inadequate data backup and disaster recovery plans
4. Outdated software dependencies causing vulnerabilities

Project-Based Risks (PBR)

1. Stock overselling due to lack of real-time inventory sync (impacts stock control & product traceability)
2. Customer order tracking failures disrupting collection and delivery scheduling

3. Producer dashboard inaccuracies causing incorrect stock levels or product details being displayed to the customer
4. Loyalty scheme data breach exposing customer discount and personal account information
5. Payment processing failures during customer checkout

Risk Matrix

Key:

- Red Coloured Cells = High priority risks

Impact	High	GTR3, PBR4	GPR1, GPR3, GTR1, PBR3, PBR5	PBR1	GPR4
	Significant		GPR2, GTR4, PBR2,	GTR2	
	Moderate				
	Low				
		Low	Moderate	Significant	High
Probability					

Risk Mitigation

Risk Description	Impact	Probability	Mitigation Strategy
Scope creep due to unclear project requirements	High	Significant	Define a clear project scope at the start of the project, while accounting for our technical ability
Key Team member unavailable	Significant	Moderate	Share knowledge among team members so if one member is unavailable another member can continue on the task without the project stopping
Insufficient testing leading to undetected bugs at launch	High	Moderate	Allocate enough time for testing before the final launch of the website
Unrealistic project milestones and deadlines	High	High	Create a realistic work/project schedule at the start of the project by breaking down projects to check how long it'll take to complete
System integration failures between third-party APIs	High	Moderate	Test the API integration towards the beginning of the project to identify compatibility issues and errors before the system is fully developed
Scalability limitations under peak user demand	Significant	Significant	Perform basic load or stress testing to simulate the experience of multiple users accessing the system

			simultaneously so Performance issues can be identified early.
Inadequate data backup and disaster recovery plans	High	Low	Use version control tools like Git which enables the tracking of project changes and restoration of previous versions of files if files have been deleted or corrupted
Outdated software dependencies causing vulnerabilities	Significant	Moderate	Regularly check and update software dependencies used in the project.
Stock overselling due to lack of real-time inventory sync (impacts stock control & product traceability)	High	Significant	Lock the stock when a customer places an order which reserves the item temporarily until the order is confirmed or cancelled. This prevents the event of multiple users buying the same item at the same time
Customer order tracking failures disrupting collection and delivery scheduling	Significant	Moderate	Make sure the tracking system is tested thoroughly by simulating placing, updating and completing orders ensuring the system correctly updates the status at each stage.
Producer dashboard inaccuracies causing incorrect stock levels or product details being displayed to the customer	High	Moderate	Ensure the dashboard data is being updated frequently from the source as it keeps stock levels accurate for both the producer and customer
Loyalty scheme data breach exposing customer discount and personal account information	High	Low	Store sensitive data using an encryption as this ensures that the database will not be accessed without permission.
Payment processing failures during customer checkout	High	Moderate	Implement error messages and a fallback option such as choosing another payment method if the payment fails.

Legal Considerations

Legal Regulation	Application
Data Protection Act(2018) / GDPR	Only necessary personal information will be collected such as name and email. A privacy policy page will also be included in the website to inform customers about how their data is being protected. Data will be encrypted the

	moment a data leak occurs to prevent it from being used.
Consumers Rights Act 2015	The product listing will detailed and accurate included with clear images, specifications and pricing. A refund policy in alignment with the law will also be included. Total price will be fully transparent including all fees including taxes without the addition of any hidden fees.
Equality Act 2010	The system will follow WCAG 2.1 AA guidelines ad a standard for the accessibility including features such as Text-to-speech and keyboard only navigation.
Food Safety Act 1990	It must display accurate info for any food or farm product which includes its origin and, ingredients and storage. Orders would be logged in a database to for traceability.
Privacy and Electronic Communications Regulations 2003 (PECR)	The website must display a cookie banner to prompt users to either accept or reject optional cookies. Tracking and marketing features will only be used after consent.

UI Considerations

The layouts will be kept clean without much clutter so Users wont get confused whilst navigating the website. Consistent colours, fonts and button styles will also be incorporated across all pages to keep it industry standard. The user interface will be simple and minimal to cater to users who vary in age as the customers will be both young and old adults. The colour scheme will be simple so the users can focus more on the product content instead of being distracted by too many colours. The website will also be accessible on different screen sizes such as laptops, tablets and phones. Images and videos incorporated will be of high quality and will cleanly match the aesthetics of the user interface. Size, colour and spacing will be used to guide users to important elements.
